

Covering letter

Dear Hiring Manager,

I am writing to apply for DevOps and Observability engineering roles where I can contribute to building reliable, scalable and easily observable production systems.

In my current role, I have worked extensively on CI/CD automation using GitHub Actions and Jenkins, improving deployment speed, reliability and reducing manual intervention. I use Docker and Kubernetes for containerization and orchestration, implementing rolling updates, autoscaling and health checks to ensure stable production workloads. I have also implemented GitOps workflows using Argo CD to enable consistent and automated deployments across environments.

On the observability side, I have hands-on experience with Splunk, including configuring forwarders, HEC inputs, managing indexes and supporting platform upgrades. I have maintained ELK stacks with Logstash pipelines and Filebeat for log ingestion and created dashboards that provide actionable insights for faster troubleshooting.

With AppDynamics, I have monitored Controllers, database agents and business transactions, along with key metrics such as latency and error rates to ensure application performance. I have also built Grafana dashboards integrating multiple data sources for real-time infrastructure and application visibility. Additionally, I have handled VTM patching across Splunk, ELK and AppDynamics nodes to maintain security, stability and system health.

Across Kubernetes and OpenShift environments, I have contributed to building a unified observability approach by integrating logs, metrics and traces, which has helped improve troubleshooting efficiency and reduce MTTR.

I am particularly motivated by building systems that are both resilient in operation and transparent when issues arise.

I would welcome the opportunity to contribute my experience to your team.

Best regards,
Madheshwaran R
